Merenstein & Gardner’s Handbook of Neonatal Intensive Care - E-Book - Sandra Lee Gardner - 2015-04-10 Merenstein & Gardner’s Handbook of Neonatal Intensive Care, 8th Edition, is the leading resource for collaborative, interprofessional critical care of newborns. Co-authored by physicians and nurses, it offers concise, comprehensive coverage with a unique multidisciplinary approach and real-world perspective that make it an essential, new edition for both neonatal nurses and physicians. The 8th edition features the latest neonatal research, evidence, clinical guidelines, and practice recommendations — all in a practical quick-reference format for easy retrieval and review of key information. UNIQUE! Multidisciplinary author and contributor team consists of two physicians and two nurses, with each chapter written and reviewed by a physician-nurse team to ensure that information mirrors current, real-world practice in a neonatal intensive care unit. Critical Findings boxes and tables outline symptoms and diagnostic findings that are based largely upon the provision of intensive perinatal care to the parturient, her fetus, and the newborn. In addition to technologic advances in the bioelectric monitoring of the fetus and newborn, the introduction of noninvasive methods to monitor oxygenation, the pharmacologic manipulation of ductus arteriosus and pulmonary vasculature, and the use of ultrasonographic diagnosis of congenital heart defects and other lesions, intensive efforts by neonatal specialists throughout the world have contributed to the decline in neonatal and infant mortality. Professors Wille and Obladen have provided an authoritative manual outlining intensive care of newborns and the ways in which the science of neonatal medicine, the technology of the 1980s, and the art of application have resulted in the practice of neonatal intensive care at the Kinderklinik of the University of Heidelberg. The English translation resulted from the success of the German edition and will serve well the needs of the English-speaking student and practitioner of neonatal intensive care. T. Allen Merrit, M.D. Neonatal Intensive Care - H.E. Umer - 2012-12-06 The significant strides made during the past decade in neonatal medicine are based largely upon the provision of intensive perinatal care to the parturient, her fetus, and the newborn. In addition to technologic advances in the bioelectric monitoring of the fetus and newborn, the introduction of noninvasive methods to monitor oxygenation, the pharmacologic manipulation of ductus arteriosus and pulmonary vasculature, and the use of ultrasonographic diagnosis of congenital heart defects and other lesions, intensive efforts by neonatal specialists throughout the world have contributed to the decline in neonatal and infant mortality. Allen Merrit, M.D. Neonatal Intensive Care Units (NICUs) - Francesco Martines - 2017 From World Health Organization data, the prevalence of hearing impairment among infants varies between 0.5 and 3.0 cases per thousand, but in children hospitalized in the Newborn Intensive Care Unit (NICU) and in those with other risk factors (i.e., anatomically small for gestational age, craniofacial abnormalities, intraterrine infections, family history of hearing loss, ototoxic drugs, mechanical ventilation, etc.), the prevalence is 10-20 times greater. Newborn Intensive Care Unit (NICU) can be defined as an intensive care unit for sick newborns who need specialized treatment. NICU combines equipment and advanced technology with medical staff specially trained in newborn care. The Joint Committee on Infants Hearing (ICH) identified many risk factors in NICU infants like prolonged mechanical ventilation, asphyxia, low birth weight and ototoxic medication, and so it also considers intensive care as a whole a risk factor. The present book focuses its attention on this hearing loss risk factor, starting from risk factors and screening strategies, highlighting the various newborn levels of care, focusing on the treatment of infants with neural tube defects and the future motor development of premature babies. This should be done until caregivers can get the attention of drug therapies used in the NICU. Mixed Blessings - Jeanne Guillemin - 1986

In just a decade's time, intensive medical care for newborns has changed
from an experimental venture to a widespread and often controversial
hospital service. The cost of newborn intensive care ranks among the top
three medical expenses in this country, and while the legal and ethical
issues of treating critically ill infants parallel those of adult patients, even
more troublesome is the issue of family versus physician control of hospital
technology. In this first inside account of the closed world of neonatal
intensive care, two medical sociologists focus on the social context for
medical decision making in the sensitive area of newborn life. Based on
observations in the most sophisticated neonatal intensive care units in
twelve U.S. hospitals, this work explores the diverse experiences and
perspectives of the parents, and all involved hospital personnel. Giving
particular attention to how physicians and nurses approach clinical work,
they raise sensitive questions and issues that are part of the fabric of
neonatal care, questions such as: When should a baby be moved into--or out
of--an intensive care unit? How much help should be given? To what extent
are parents regularly excluded from decisions made about the fate of their
child? The result is an enthralling ethnography both fascinating and eye-opening. In the final chapters the authors offer policy
recommendations that address the social and professional problems
associated with newborn intensive care. This controversial new field of
medical care is of increasing public concern as more and more babies are
entering intensive care units and the previous limits of human life are being
continually challenged and extended.

**Infants in Crisis** - Glenn Affleck - 2012-12-06

The emotional impact of having a newborn hospitalized in an intensive care unit is immense. The parents' perceptions of the child's fragility and of their role in the vulnerable child's life represent important facts of the crisis in which the infant and the parents are involved. Such early stress marks the child's later development which may include chronic ailments and learning disabilities. This book explores a whole spectrum of psychological questions raised by the birth of medically fragile infants, from the parents' ability to restore a sense of meaning and mastery in the face of the profound challenges confronting them, to the importance of social support and coping strategies, and finally, to the crisis of newborn intensive care in the context of the marital relationship.

Religion and Ethics in the Neonatal Intensive Care Unit - Ronald M. Green - 2019-09-04

Each year, neonatal intensive care units (NICUs) in the U.S. and around the world help thousands of sick or premature newborns survive. NICUs are committed to the ideals of family-centered care, which encourages shared decision-making between parents and NICU caregivers. In cases of infants with conditions marked by high mortality, morbidity, or great suffering, family-centered care affirms the right of parents to assist in making decisions regarding aggressive treatment for their infant. Often, these parents’ difficult and intimate decisions are shaped profoundly by their religious beliefs. In light of this, what precisely are the teachings of the major world religious traditions about the status and care of the premature or sick newborn? Few studies have grappled with what major religious traditions teach about the care of the newborn or how these teachings may bear on parents’ decisions. This volume seeks to fill this gap, providing information on religious teachings about the newborn to the multidisciplinary teams of NICU professionals (neonatologists, advance practice nurses, social workers), as well as to parents of NICU patients, and students of bioethics. In chapters dealing with Judaism, Catholicism, Denominational Protestantism, Evangelical Protestantism, African American Protestantism, Sunni and Shia Islam, Hinduism, Buddhism, Navajo religion, and Seventh Day Adventism, leading scholars develop the teachings of these traditions on the status, treatment, and ritual accommodations of care of the premature or sick newborn. This is an essential book that will serve as a first resort for clinicians who need to understand the religious dynamics influencing anyone making a difficult decision about her sick newborn.

Design for Pediatric and Neonatal Critical Care provides an overview of the design and research issues associated with the development of environments for pediatric and neonatal intensive care. This is the first and only book dedicated to this topic and was created to support individuals interested in developing and studying critical care environments for children and their families. In addition to a detailed analysis of the literature from research and practice, the author provides a summary of the historical development of critical care for infants and children, and information regarding the role of PICUs and NICUs in the critical care system. A discussion of current codes and future trends is also provided. Design for Pediatric and Neonatal Critical Care includes essays from prominent voices in the field ranging from inspired young architects and researchers to world-renowned healthcare design and research icons. Illustrations of work that has been identified as exemplary or representative of recent directions are included, which will help those planning new or remodeled projects to identify and examine precedents. This book is intended to help designers and researchers enhance healing environments for young patients in critical care settings and provide information in support of the families and staff who provide care for these children and infants.

Midline Catheter Use in the Newborn Intensive Care Unit - Tricia L. Ronesberg - 2014
Ongoing evaluation of current practice and incorporation of evidence based research into guidelines and protocols is a requirement for the provision of observational data, midline catheters (MCs) are not an appropriate vascular access device for Newborn Intensive Care Unit (NICU) patients due to insufficient high level evidence demonstrating safety and efficacy. In addition, national guidelines for MC use in neonatal and infant patients lacks sufficient information for safe and effective use of MCs. The results of this small, online survey indicate that while some neonatal nurses and Nurse Practitioners report the use of MC use in the NICU, there is a wide range of practice pertaining to MC unit-specific protocols, competencies, success with placement, and clinician agreement of appropriate use for this vascular access device (VAD). Multicenter, randomized control trials are needed to evaluate current MC practice in the NICU, and institutions must incorporate current, evidence based practice into policies, procedures, and guidelines.
