**The American Psychiatric Association Practice Guidelines for the Psychiatric Evaluation of Adults, Third Edition**

American Psychiatric Association - 2015-07-29

Since the publication of the Institute of Medicine (IOM) report Clinical Practice Guidelines We Can Trust in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for inclusion of a guideline in the National Guidelines Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process APA's practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions of relevance to an overarching subject area. A systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of individual studies. The quality of the overall body of evidence is also rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Clear, concise, and actionable recommendation statements help clinicians to incorporate recommendations into clinical practice, with the goal of improving quality of care. The new practice guideline
opinion survey have also been taken into consideration in making recommendations or suggestions. In addition to reviewing the available evidence on psychiatry evaluation, each guideline also provides guidance to clinicians on implementing these recommendations to enhance patient care.

Life-Span Research on the Prediction of Psychopathology - L. Erlenmeyer-Kimling - 2021-09-30

The theme of the conference was life span research on the prediction of psychopathology, and the goal was to bring together outstanding researchers who were engaged in longitudinal investigations at the time and whose work, collectively, covered the entire life-span, from infancy to old age. Diagnostic and Structured Interviewing - Richard Rogers - 1995

In an increasingly competitive marketplace, psychologists and other mental health professionals strive to offer the best validated assessment methods tailored to their target populations. Handbook of Diagnostic and Structured Interviewing represents a new and important resource for clinical practice. The volume offers crucial guidance on the selection of appropriate measures for Axis I disorders, Axis II disorders, and specialized syndromes, marshaling up-to-date data on reliability, validity, and clinical applications. Providing the knowledge needed to make informed, appropriate use of these effective - and increasingly sophisticated diagnostic tools, the Handbook is an essential tool for today's clinician and researcher.

Schizophrenia Bulletin - 2006
The Society for Life History Research in Psychopathology is a group of investigators from many disciplines who share an interest in studying the longitudinal aspects of psychiatric disorder. Sociologists, psychologists, statisticians, psychiatrists, epidemiologists, and others each bring to the study of life history the expertise and vantage point arising from his or her unique training and experience. This volume, the fifth in a series, is devoted to exploring the methods used to contribute to the understanding of the complex unfolding of a human life as it avoids, copes with, or succumbs to psychiatric disorder. We hope that by describing these methods, their current status, advantages, and short comings, this volume can serve as a guidepost to all who are involved in our field to help understand it further and to generate solutions for the many crucial problems we face.

**Evaluation of the Alcoholic** - - 1981

**Gulf War and Health** - Institute of Medicine - 2008-03-25

The sixth in a series of congressionally mandated reports on Gulf War veterans’ health, this volume evaluates the health effects associated with stress. Since the launch of Operation Desert Storm in 1991, there has been growing concern about the physical and psychological health of Gulf War and other veterans. In the late 1990s,
Congress responded by asking the National Academy of Sciences (NAS) to review and evaluate the scientific and medical literature regarding associations between illness and exposure to toxic agents, environmental or wartime hazards, and preventive medicines or vaccines in members of the armed forces who were exposed to such agents. Deployment to a war zone has a profound impact on the lives of troops and on their family members. There are a plethora of stressors associated with deployment, including constant vigilance against unexpected attack, difficulty distinguishing enemy combatants from civilians, concerns about survival, caring for the badly injured, and witnessing the death of a person. Less traumatic but more pervasive stressors include anxiety about home life, such as loss of a job and income, impacts on relationships, and absence from family. The focus of this report, by the Institute of Medicine (IOM) Committee on Gulf War and Health: Physiologic, and Psychosocial Effects of Deployment-Related Stress, is the long-term effects of deployment-related stress. Gulf War and Health: Volume 6. Physiologic, and Psychosocial Effects of Development Related Stress evaluates the scientific literature regarding association between deployment-related stressors and health effects, and provides meaningful recommendations to remedy this problem.

Updated for DSM-IV, the Structured Interview for DSM-IV Personality (SIDP-IV) is a semi-structured interview that uses nonpejorative questions to examine behavior and personality traits from the patient's perspective. Structured Interview for DSM-IV Personality
- Bruce Pfohl - 1997

Updated for DSM-IV, the Structured Interview for DSM-IV Personality (SIDP-IV) is a semi-structured interview that uses nonpejorative questions to examine behavior and personality traits from the patient's perspective. The SIDP-IV is organized by topic sections rather than disorder to allow for a more natural conversational flow, a method that gleans useful information from related interview questions and produces a more accurate diagnosis. Designed as a follow-up to a general psychiatric interview and chart review that assesses episodic psychiatric disorders, the SIDP-IV helps the interviewer to more easily distinguish lifelong behavior from temporary states that result from an episodic psychiatric disorder. During the session, the interviewer can also refer to the specific DSM-IV criterion associated with that question set. In the event that the clinician decides to interview a third-party informant such as family members or close friends, a consent form is provided at the end of the interview. With this useful, concise interview in hand, clinicians can move quickly from diagnosis to treatment and begin to improve their patient's quality of life.
