Pharmacokinetics: The Basis of Individual Dosage. 1987: New York: McGraw-Hill. 1987. The pharmacokinetics of protein binding and the desirability of achieving therapeutic ranges in the treatment of cystic fibrosis is described. The importance of accurate dosing in practice is emphasized, and the pharmacokinetic considerations that underlie the selection of optimal drug regimens are discussed. The book also provides a comprehensive review of the pharmacokinetics of the major drugs used in the treatment of cystic fibrosis, including antibiotics, anti-inflammatory agents, and other medications used in the management of this disease. The book is intended for practicing clinicians who care for patients with cystic fibrosis and for residents and fellows in pulmonary medicine. It is also useful for medical students and residents in internal medicine.

Chronic Nephritis: Basic Pathophysiology and Treatment. 2006: Philadelphia: Lippincott Williams & Wilkins. This book provides a comprehensive overview of the pathophysiology and treatment of chronic nephritis. The authors discuss the clinical manifestations, natural history, and management of chronic nephritis, including the role of dialysis and transplantation in its treatment. The book also covers the latest advances in the management of chronic nephritis, including new drug therapies and the use of bioengineered renal tissues for transplantation. The book is intended for nephrologists, internists, and other clinicians who care for patients with chronic nephritis.

Drug Prescribing in Renal Failure: Dosing Guidelines for Adults. 2013: Philadelphia: Lippincott Williams & Wilkins.
