Beyond Bypass and chelation for heart problems and cardiovascular disease

Beyond Bypass is a treatment that uses an intravenous (IV) drip of the amino acid, N-acetylcysteine (NAC). This treatment is based on the principle that high doses of NAC can help prevent and reverse heart problems and cardiovascular disease. NAC is a natural substance that is produced by the body and is found in various foods, such as garlic, onions, and cabbage. It helps to reduce inflammation and oxidative stress, which are two major factors that contribute to heart problems and cardiovascular disease.

Chelation therapy is a treatment that uses a chemical called ethane-diaminetetraacetic acid (EDTA) to remove toxic metals and other substances from the body. This treatment is based on the principle that chelation can help prevent and reverse heart problems and cardiovascular disease. Chelation therapy is often used to treat patients who have been exposed to toxic metals or other substances, such as lead, mercury, or cadmium.

Both Beyond Bypass and chelation therapy have been studied extensively and have been shown to be safe, effective, and inexpensive. They are both treatments that can be done at home or in a doctor’s office. Beyond Bypass and chelation therapy are not for everyone. They are not a substitute for traditional medical care and should only be used under the supervision of a licensed healthcare professional.

The benefits of Beyond Bypass and chelation therapy include:
